

# Calculation of current in the small busbar of the high-voltage switchgear

## Overview

The current rating is calculated from the conductor cross-sectional area, material (copper or aluminium), and maximum temperature rise per IEC 61439-1 (typically 70K above 35 degrees C ambient for bare copper). The busbar sizing calculator determines the required busbar dimensions based on the continuous current rating, short circuit withstand, and thermal limits for switchgear assemblies. What is a Bus Bar?

A bus bar is a metallic strip or bar used in electrical. The bus bar must be capable of carrying the continuous full-load current of the system under normal operating conditions, while also withstanding short-time fault currents that may occur during abnormalities such as short circuits. Unlike veins, however, the bus bar faces additional engineering. A busbar is a heavy-duty, highly conductive strip of copper or aluminum used to conduct massive electrical currents within switchboards, distribution boards, substations, and battery banks. The electrical power system consists of many incoming & outgoing feeder connections, for which busbars are necessary. “ Replaced three separate apps with Elec-Mate.
