

Digital Optical Cable Interface Type

Overview

Optical audio, also known as Toslink or SPDIF (Sony/Philips Digital Interface Format), is a type of digital audio connection that uses light to transmit audio signals. TOSLINK (Toshiba Link) is a standardized optical fiber connector system. TOSLINK cables use fiber optic technology to transmit digital audio signals, which makes them distinct from other types of audio cables that use electrical. S/PDIF is a widely used digital audio interface that comes in two physical forms: coaxial (RCA) and optical (TOSLINK) – despite the S/PDIF acronym often being associated with the coaxial inputs. Both handle bit depths of up to 24-bit. Coaxial cables carry electrical signals over conductors while. There are three popular ways to physically transfer audio between devices. Analog via Copper Wire: RCA, XLR, or 3. Optical is a good alternative to HDMI for audio when you need to separate audio and video connections or don't have enough HDMI ports. Optical and coaxial.
