

# Does an OTN device have router functionality

## Overview

No, an ONT is not a router. An ONT converts optical signals into electrical signals, but it does not perform the routing functions that direct traffic between devices on a network. What Is a Router?

A router. The ONT transmits the data via one or more Ethernet ports to a router, computer or other connected devices, delivering internet access to your end users. In. An optical transport network (OTN) is a digital wrapper that encapsulates frames of data, to allow multiple data sources to be sent on the same channel. ITU-T defines an optical transport network as a set of optical network. OTN is the ideal technology to bridge the gap between next generation IP and legacy Time Division Multiplexing (TDM) networks by acting as a converged transport layer for newer packet-based and existing TDM services. Key elements of OTN include: Standardized framing (the “digital wrapper”): OTN adds overhead. While both ONTs and routers play crucial roles in the functioning of a network, they serve distinct purposes and have different functionalities.
