

# Methods for inspecting fiber optic cable splices

## Overview

Effective fiber testing utilizes advanced tools such as Optical Loss Test Sets (OLTS), Optical Time-Domain Reflectometers (OTDR), and Visual Fault Locators (VFL) to diagnose and correct issues, ensuring optimal network performance. Fiber Optic Testing is used to evaluate the performance of fiber optic components, cable plants and systems. As the components like fiber, connectors, splices, LED or laser sources, detectors and receivers are being developed, testing confirms their performance specifications and helps. These test procedures assess the physical and functional qualities of fiber optic cables, connectors, and the network as a whole. Since fiber optic transmissions typically operate in the infrared spectrum (invisible to the naked eye), visible light sources such as visual fault finders or visible fault locators can be used to. Here are the most common fiber optic testing methods used by network professionals: Conducting a visual inspection test involves using a fiber scope or microscope to examine the endfaces of connectors for dirt, scratches, or cracks. Always inspect before you connect.
